Root Canal Treatment Postoperative Instructions

Your root canal treatment may take one or more visits to complete. During treatment your endodontist will remove the disease pulp, then clean, shape and fill the root canal to prevent contamination. This information will help answer some of your questions about what to expect and how to take care of your mouth after treatment.

What to expect after Treatment

Because cleaning the root canals may cause inflammation of tissue surrounding the tooth you may experience some discomfort for a day or so.

Over-the-Counter analgesics usually alleviate the discomfort. Talk with your endodontist about which medication to take. If the discomfort continues, or if you have severe pain or swelling, call your endodontist.

Between appointments a temporary filling or crown is placed. Because temporary restorations will eventually loosen, see your general dentist promptly following completed root canal treatment for final restoration.

Sometimes antibiotics are prescribed to help control infection. Please take all medication as directed.

How to take Care of Your Mouth

Avoid chewing or biting directly on the treated tooth until your general dentist replaces the temporary restoration.

If medication is prescribed, take it only as directed.

Return for a follow-up exam after treatment as directed make sure there has been proper healing of the tissues surrounding the tooth root.

Retreatment May Occasionally be Necessary

Even though the pulp of the tooth was removed, the tooth is still nourished from surrounding tissues. As with any living tissue, treatment is occasionally unsuccessful and retreatment, or removal of the tooth may be necessary.
